Campus Problem Reporting System

FULL STACK DEVELOPMENT PROJECT

Presented by: P.MADHYUSHA

Course / Branch: Cse e

College:] Pragati engineering college

Date: April 27, 2026

Project Mission

To bridge the gap between students and administration through a seamless, transparent, and efficient digital reporting ecosystem.

#FULLSTACK #UXDESIGN #CAMPUSINNOVATION #CLIENTSIDESTORAGE

Digitalizing Campus Issue Management

MOVING FROM MANUAL TO EFFICIENT REPORTING

The Challenge

Campus issues like WiFi outages, broken furniture, and maintenance needs are common but often go unreported due to lack of a proper channel.

Inefficiency

Manual reporting is slow, prone to human error, and difficult for administrators to track or prioritize effectively.

The Solution

A digital platform provides an easy, centralized way for students to report and track problems in real-time, ensuring accountability.

Project Objectives & Goals

STREAMLINING COMMUNICATION AND RESOLUTION

Web-Based System

Develop a user-friendly, accessible interface for reporting campus problems from any device with a browser.

Student Empowerment

Allow students to easily submit complaints and track their progress, fostering a sense of community responsibility.

Admin Management

Enable administrators to view, categorize, and resolve issues efficiently through a centralized management panel.

Real-Time Tracking

Provide transparency through live status updates, ensuring students are informed at every stage of the resolution process.

Technology Stack & Architecture

BUILDING A LIGHTWEIGHT CLIENT-SIDE APPLICATION

HTML5

Semantic structure for the reporting interface.

CSS3

Modern, responsive styling and layout design.

JavaScript

Application logic, DOM manipulation, and data handling.

LocalStorage

Persistent browser-based data storage.

System Architecture

The system follows a **Serverless Client-Side** architecture where all processing and storage happen within the user's browser.

This approach ensures high speed, zero hosting costs for the database, and immediate responsiveness for the user interface.

Note: No backend server is required. The application is fully functional as a standalone client-side tool.

Core System Modules

TAILORED EXPERIENCES FOR STUDENTS AND ADMINS

Student Module

- Secure Registration & Login
- Problem Reporting with Details
- Personal Tracking Dashboard
- View Resolved History

Admin Module

- Administrative Secure Login
- Centralized Complaint Overview
- Status Management & Updates
- Issue Resolution Tools

Key Features & Functionality

ENHANCING USER EXPERIENCE AND EFFICIENCY

Authentication

Secure logins with role-based access to protect student and admin data.

Multimedia Support

Attach images to reports so maintenance teams see visual evidence quickly.

Interactive Dashboard

Central hub showing live statistics and status updates for all reports.

Responsive Design

Fluid UI that adapts across desktops, tablets, and smartphones.

SECURE ACCESS

VISUAL PROOF

LIVE STATS

MOBILE READY

The Working Process

FROM REPORTING TO RESOLUTION

1

User Access

Students register and log into the system using their campus credentials.

2

Submission

A problem is reported with a description and optional image, then stored instantly in LocalStorage.

3

Admin Review

Administrators access their dashboard to view, categorize, and prioritize pending issues.

4

Resolution

The maintenance team fixes the issue, and the Admin updates the status in the system.

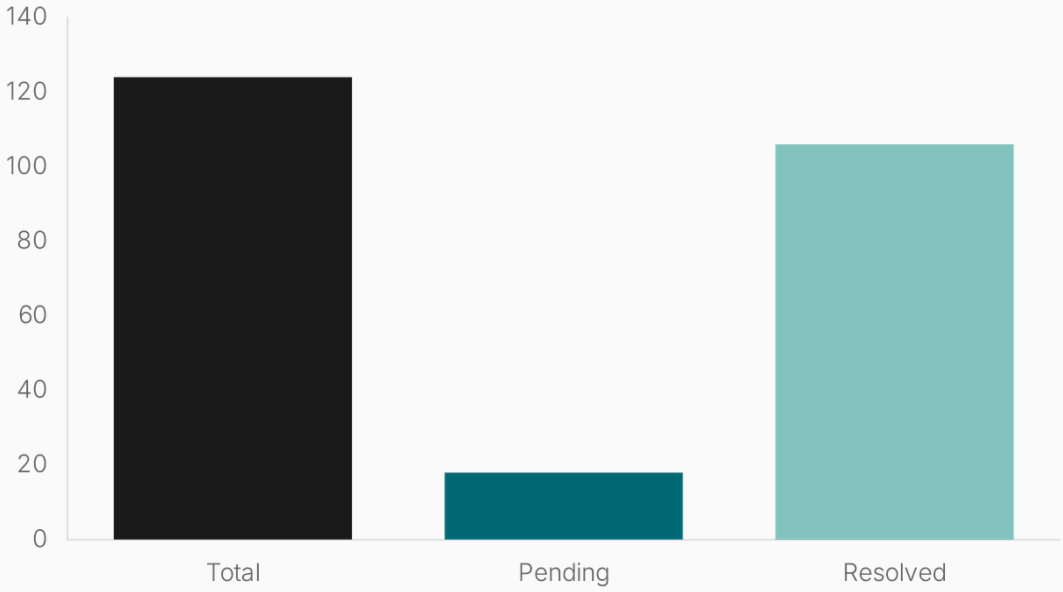
5

Feedback

The student's dashboard reflects the updated status automatically, closing the loop.

Dashboard & Statistics

REAL-TIME INSIGHTS AT A GLANCE



124

TOTAL PROBLEMS

18

PENDING ISSUES

106

RESOLVED CASES

The dashboard provides a quick overview of system health, allowing administrators to monitor resolution rates and identify recurring campus issues instantly.

System Advantages

WHY CHOOSE A DIGITAL REPORTING SYSTEM?

User-Friendly Interface

Simple and intuitive design reduces the barrier to reporting, encouraging students to participate in campus maintenance.

Speed & Efficiency

Instant submission and real-time updates eliminate the delays associated with manual paperwork and physical office visits.

Organized Management

Structured data storage replaces messy logs, allowing administrators to categorize, search, and prioritize issues effectively.

Limitations & Challenges

UNDERSTANDING THE CURRENT SCOPE

Storage Constraints

Data is stored exclusively in the browser's LocalStorage, which has a limited capacity (typically 5-10MB).

Basic Security

The current authentication is client-side, suitable for a prototype but lacks server-side validation for production.

Scalability

Designed as a standalone client-side application, it is not yet optimized for large-scale multi-user environments.

Data Persistence

Clearing browser cache or switching devices results in data loss as there is no centralized database.

Impact Analysis

While these limitations define the project as a "Proof of Concept," they also highlight the specific areas where future development is required.

The current architecture prioritizes speed and ease of deployment over long-term data integrity and high-level security protocols.

Future Enhancements

ROADMAP FOR SYSTEM EVOLUTION

Backend Integration

Transition from a client-side only application to a robust server-side architecture using Node.js or PHP for enhanced security and processing.

Database Migration

Implement a centralized database like MongoDB or MySQL to replace LocalStorage, ensuring data persistence across different browsers and devices.

Real-Time Notifications

Integrate email and SMS alerts to notify students and administrators instantly when a problem is reported or its status is updated.

Mobile Application

Develop native iOS and Android versions of the platform to provide a more seamless and accessible reporting experience for students on the move.

Conclusion

Project Success

Successfully developed a functional, web-based problem reporting system using a modern client-side stack.

Operational Impact

The system streamlines communication between students and administration, ensuring faster issue resolution.

Educational Value

Demonstrates core full-stack development concepts, including responsive UI design and persistent data handling.

Thank You!
